

Registry

1. New service comes online. Sends a POST '/register'
2. registry receives the post, updates service List
3. user A sends a GET '/Lookup/<service name>'
4. registry gets the GET, sends the IP to user A
5. User A connects with given IP.

Lacking Auth to check if new service is safe
Lacking persistent DB

Others: registry running health check every 3s to keep an updated service List.
